1. Main result

The rise is concentrated in the last two measurements (Figure 1). The relative changes and the turning point are needed to interpret this claim.

Submission policy for this fixture: all figures must appear after the text. A final typeset reading copy will place them near their citations.

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.
