List of Figures

Figure 1. Response across settings 3

This page is a navigational directory.

1. Acquisition protocol

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.

2. Observed response

The response increases most strongly at the end of the range (Figure 1).

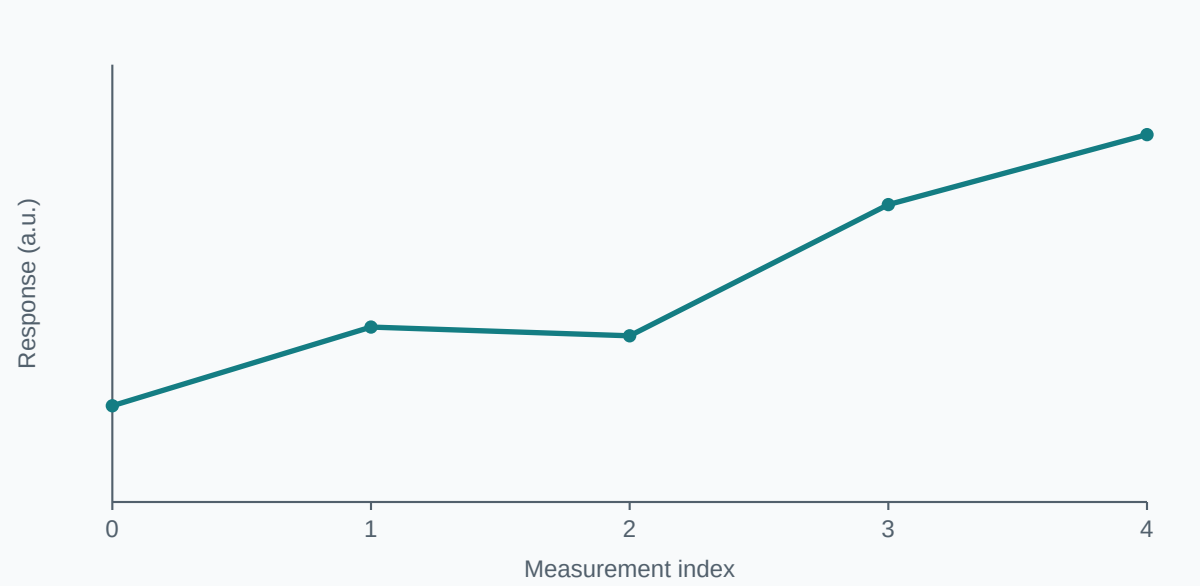

Figure 1. Response across repeated measurement settings.

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.
