1. Roadmap

The paper introduces the acquisition protocol, then summarizes the response in Figure 1, and finally describes the controls.

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.

3. Observed response

The first three measurements are almost flat, whereas the last two increase markedly (Figure 1). Inspecting the bend is essential to this comparison.

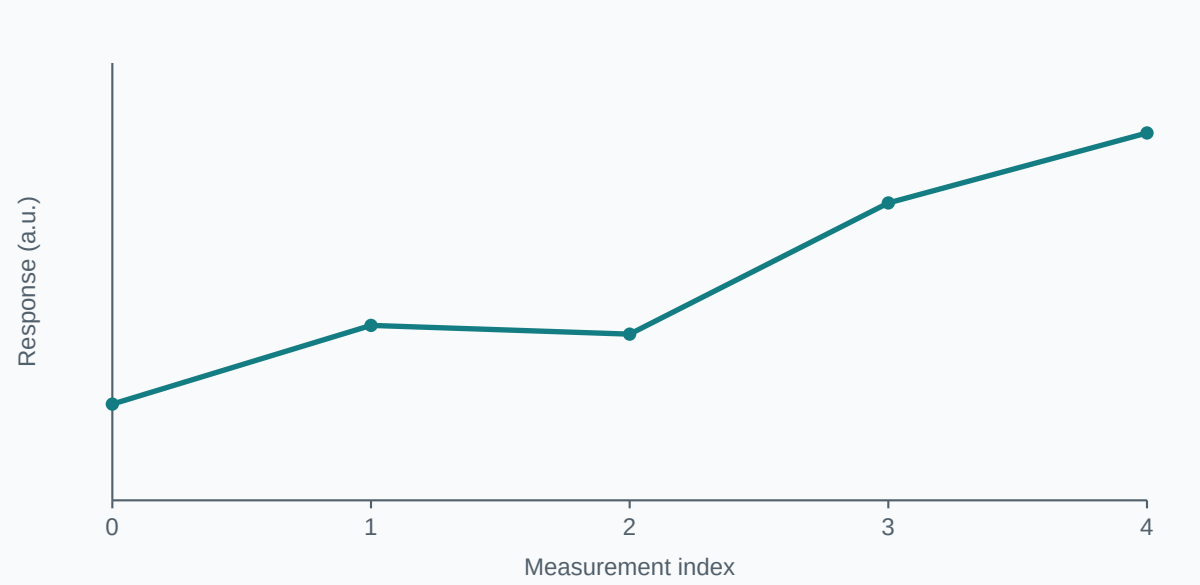

Figure 1. Response across repeated measurement settings.

The observations were collected under the same acquisition protocol. Each sample contributes one independent measurement. The reported comparison is restricted to this controlled setting. Additional details document how the experimental record was assembled.
