Controlled response comparison

Synthetic layout test; the observations below are fictional.

Results

Figure 1 shows the treatment and control responses at 0, 1, 2, 3, and 4 seconds. The curves begin at the same level and diverge after 1 second. Under the tested conditions, the treatment response reaches 2.4 a.u.; the control reaches 1.4 a.u. These observations describe this sample only.

Acquisition and interpretation

Both groups use the same acquisition protocol. Time is measured in seconds and response in arbitrary units. The chart preserves every supplied observation. The connecting segments are visual guides and do not add measurements.

The study design does not establish causality. The limited sample and controlled conditions restrict generalization. Layout changes must retain these qualifications.

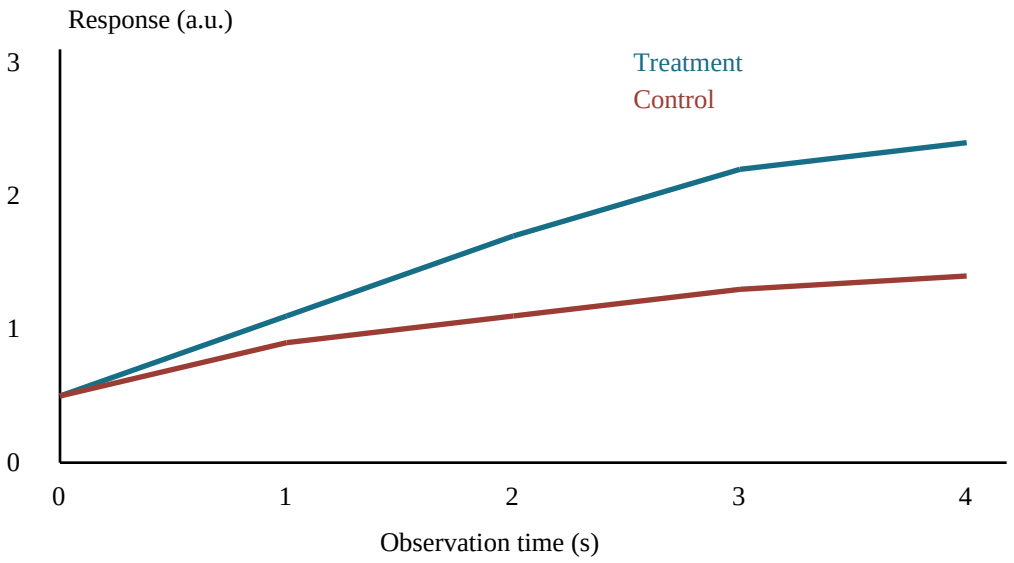

Figure 1. Treatment and control response over 4 seconds. Lines connect the five observed values in each series.
